

People never thought, knew, or imagined that artificial intelligence would shape and mold our world in the way it does. We always imagined that it would just be a fancy search engine, an emboldened smartphone, or even electronic doors. Yet it just moved through the bias of unreason and crushed the impossible. Today, artificial intelligence is as common as word processors. We use them to generate essays, edit PDF documents, correct our resumes, or even generate images.

Yet there comes a time when we must perhaps stop to think about the negative effects of AI. AI relationships are ruining our world. Students no longer think about assignments or even yet pause to study. We must balance our reasoning between the two. Are we just going to be lazy couch potatoes doing nothing all day? Absolutely not. Yet are we to shun AI as a wicked imagination? I don't think so.

The balance takes shape when you use it carefully and wisely. For example, an instance would be someone using AI to research some topics for them, then refining the AI facts and using them. Or, just even brainstorming. But we cannot allow AI to take over our lives.
